

Comparing Tests for Diabetes and Prediabetes: A Quick Reference Guide

On this page:

- [Confirming Diagnosis of Type 2 Diabetes and Prediabetes](#)
- [Interpreting Laboratory Results](#)
- [Comparing Diabetes Blood Tests](#)
- [Comparing Diagnoses](#)

This fact sheet compares the following tests:

- A1C test
- fasting plasma glucose (FPG) test
- oral glucose tolerance test (OGTT)
- random plasma glucose (RPG) test

In addition, the National Diabetes Education Program (NDEP) offers a pocket guide, *Diabetes Numbers At-a-Glance*, which can be ordered at www.ndep.nih.gov. Both resources utilize current American Diabetes Association (ADA) clinical recommendations for diagnosing and managing diabetes and prediabetes.¹

Confirming Diagnosis of Type 2 Diabetes and Prediabetes

Diagnosis must be confirmed unless symptoms are present. Repeat the test using one of the following methods:

- Repeat the same test on a different day—preferred.
- If two different tests are used—e.g., FPG and A1C—and both indicate diabetes, consider the diagnosis confirmed.
- If the two different tests are discordant, repeat the test that is above the diagnostic cut point.

If diagnosis cannot be confirmed using the results of two tests, but at least one test indicates high risk, health care providers may wish to follow the patient closely and retest in 3 to 6 months.¹

Interpreting Laboratory Results

When interpreting laboratory results health care providers should

- consider that all laboratory test results represent a range, rather than an exact number²
- be informed about the A1C assay methods used by their laboratory²
- send blood samples for diagnosis to a laboratory that uses an NGSP-certified method for A1C analysis to ensure the results are standardized³
- consider the possibility of interference in the A1C test when a result is above 15% or is at odds with other diabetes test results¹
- consider each patient's profile, including risk factors and history, and individualize diagnosis and treatment decisions in discussion with the patient¹

Comparing Diagnoses

In some people, a blood glucose test may indicate a diagnosis of diabetes even though an A1C test does not.

The reverse can also occur—an A1C test may indicate a diagnosis of diabetes even though a blood glucose test does not.

Because of these variations in test results, health care providers should repeat tests before making a diagnosis. People with differing test results may be in an early stage of the disease, where blood glucose levels have not risen high enough to show on every test.
